

Assessment Brief Pro Forma

1. Module number	SET08122
2. Module title	Algorithms and Data Structures
3. Module leader	Christos Chrysoulas
4. Tutor with responsibility for this Assessment Student's first point of contact	Christos Chrysoulas – 1 st point of contact Moderator: Emma Hart
5. Assessment	See Attached coursework description
6. Weighting	100%
7. Size and/or time limits for assessment	See Attached coursework description
8. Deadline of submission CW Part 1 (30%) CW Part 2 (70%) Your attention is drawn to the penalties for late submission	For CW Part 1: 3pm on Friday 4th March For CW Part 2: 3pm on Friday 29th April Your attention is drawn to the penalties for late submissions.
9. Arrangements for submission	Submit via Moodle
10. Assessment Regulations All assessments are subject to the University Regulations.	Normal regulations.
11. The requirements for the assessment	See coursework specification below.
12. Special instructions	None
13. Return of work	Feedback will normally be supplied within 3 working weeks of a submission. Student work will not be returned.
14. Assessment criteria	See coursework specification attached. You are advised to follow normal academic conventions for acknowledging sources.

Algorithms & Data Structures SET08122

Coursework Specification

1 Task

The objective of this coursework is to demonstrate your understanding of both theory and practise in relation to the content of the Algorithms and Data Structures module. Your specific task is to implement a simple, command-line only (no GUI or graphics) version of the “Sudoku”¹ game using the programming language of your choice. The core goal of your implementation should focus on your choice of data structures and algorithms needed to implement the game. You must think carefully about which data structures and algorithms are appropriate to your solution and apply them effectively in your implementation.

The minimum requirement is that you will, using your knowledge both from taught interactions and self-directed learning, identify and implement appropriate data structures and associated algorithms to represent and manipulate at least the **Game board** - the space in which the game is played and be in position to play a round of the game in full. Meaning that there should be at least some checking that the number is valid and to recognise a completed game. There should be an initial menu from where the player can choose one the following difficulty levels: a) Easy, b) Medium and c) Hard.

For every data structure and algorithm that you use in your solution, you must have evaluated and justified your choice. Ideally you will have considered alternative approaches for each aspect of the program, for example, there are multiple methods for implementing a game board, each of which has advantages and disadvantages. You should also consider how your choices of data structures and algorithms will perform as the amount of data that they manipulate varies. All these aspects should be considered within your written report.

To earn a better grade there are some additional requirements:

- Your game should record the history of play and allow earlier games to be automatically re-played from this record, i.e. the sequence of moves that the player(s) make during a game, so that each game that is played

¹ If you are unfamiliar with Sudoku, then some background about the game can be found here: <https://en.wikipedia.org/wiki/Sudoku>

can be recorded and re-played. Subsequent automatic replaying a record of an earlier game from the record is a part of this requirement.

- Your game should support undo, i.e. once a move is made you should be able to un-apply it, returning the game state to the immediate previous state. Your players should be able to undo moves right back to the initial game state.
- Once an undo facility is working your game can be extended to support redo of moves that have been undone.
- Extra options to be considered. Options like playing against time. For example, 7 minutes to finish the game.

If you are aiming for a grade at the upper end of the grading scale (for example 80+) and have completed the requirements then you should consider extending the core requirements to demonstrate your self-directed learning, for example, directions that you might consider could be game boards of various sizes. Whilst the default is traditionally 9 rows x 9 columns, larger, or differently shaped boards can lead to interesting consequences in terms of how a game is played and this might require an adjustment to how you implement your game rules. Another goal might be to provide insight for the remaining places. For example, the game can also keep track and let the player know how many of each number are left for the board to be solved. More advanced functions will support for example a game against a clock.

This coursework should be fun, so use your imagination, and give your creativity a free rein. Invention and originality will be rewarded by the marking scheme. I hope you enjoy working on it.

2 Submission & Deliverables

Your coursework deliverables comprise the following:

1. Coursework Part 1

The first part of the coursework should be considered as an initial design document, which should also include a detailed as possible literature review. Study and critically evaluate what others have done on the field and what are their pros and cons. Eventually you should be in position to propose possible ways to go on with your own implementation. In detail explain the features that you plan to include in your delivery. Of course, these can change as you proceed with the actual implementation during the phase 2 of the Coursework.

All the above should be well documented in a report that you will have to deliver by the (hard) deadline placed by the Teaching Team and can be also

found on the first page of the coursework descriptor. The style of writing, the coherence, and the detail on which you have delved will be assessed and marked.

Your report must be no longer than 3 pages in length (excluding appendices). Appendices may be used to include supplemental data, screenshots, or documentation, but these must be referenced from within the main body of your report. The format of the submitted report must be PDF and should include the following sections:

Title of your report.

Introduction Describing the problem & giving an overview of features.

Design Explaining how you plan to design & architect your software paying particular attention to the algorithms and data structures to be used. In this section you must identify and justify the inclusion of each data structure utilised by your game based on the research you have done. In detail explain the features that you plan to include in your delivery.

References (Optional) If you have used additional resources then these should be cited. Otherwise, this section may be omitted.

All work must be your own work. If you have been inspired by work from elsewhere then it is worth playing safe and explicitly recording the source of any code, design ideas, or approaches that you may have adopted. Properly referencing, quoting, and citing the work of others is generally a good and safe way to do this.

2. Coursework Part 2

For the Second part of the coursework the following should be delivered:

- Source code (60%)
- Report (30%)
- Demonstration/Video upload (10%)

If you are in any doubt about any of the requirements for the coursework or any aspect of the submission procedure, then please contact the module coordinator for further guidance. If, due to your circumstances, you are unable to complete your assignment on time and require an extension or something similar, then please adhere to the “Fit to sit” regulations which are available from, and detailed on, MyNapier.

2.1 Source-code (60%)

You must use the any programming language of your choice and your program must compile at the command prompt on a JKCC machine into a single executable.

Your submission must contain all of the source-code required to rebuild your executable. You should also contain clear and detailed instructions in a readme.txt file for performing that process. It is in your interests to ensure that the build process is as straightforward as possible. Your submission must contain only the files required for this submission and not your entire SET09417 folder of workbook and lab content. It is your responsibility to ensure that you have placed all the source code necessary to build your software into your submitted folder.

Your source-code and a final executable must be submitted on Moodle. Please do not forget that **there should also be a Readme.txt file available explaining how to compile – execute the provided code.**

2.2 Report (30%)

Your report must be no longer than 2 pages in length (excluding appendices). Appendices may be used to include supplemental data, for example test data, screenshots, or documentation, but these must be referenced from within the main body of your report. The format of the submitted report must be PDF and should include the following sections:

Title of your report.

Introduction Short description of the problem & an overview of features.

Critical Evaluation Explaining the features that you feel work well, or work poorly, and why you think this. Reflect on what you have proposed for the first part of the CW. Clearly present/list what features/options you managed to add to the initial, basic implementation. You should, where possible, support your evaluation with experimental results.

References (Optional) If you have used additional resources then these should be cited. Otherwise, this section may be omitted. All work must be your own work. If you have been inspired by work from elsewhere then it is worth playing safe and explicitly recording the source of any code, design ideas, or approaches that you may have adopted. Properly referencing, quoting, and citing the work of others is generally a good and safe way to do this.

2.3 Demonstration (10%)

All coursework must be demonstrated. You should prepare a five (5) minutes long video to demonstrate your work. No need to go through the code you wrote. You can send the link to your video, so no need to upload it on Moodle. Please make sure to give the proper rights to the Module Leader to access the video.

Without a demonstration your submission will not be marked.

3 Important Dates & Deadlines

Submission deadline: Coursework Part 1: 3PM on Friday 4th March and for Coursework Part 2: 3PM on Friday 29th April

Return of work: you will be emailed written summative feedback within three working weeks of the submission deadline. Note that you will also have likely engaged with teaching staff about your assignment on many occasions during the trimester and these are all opportunities for formative feedback.

4 Assessment Criteria & Marking Scheme

This coursework is worth 100% of your overall grade for this module. The following marking guide indicates what is expected for each major grade band for this coursework assignment:

0-40% There is a number of ways to achieve a mark in this band, but generally you will either have failed to create a working Sudoku game, omitted major functionality such as a minimum requirement, have used a wholly inappropriate and unjustified approach, failed to include report(s), or the report(s) will be wholly inadequate in justifying the decisions that you've made in your code.

40-49% To achieve a mark in this band you must have developed your own working Sudoku game. This means you will have designed and implemented a playable game that meets the minimum requirements. It may be based directly on an extension of the practical work covered in class and your report(s) must adequately describe your work but might omit sections. The quality of your implementation and associated report(s) will dictate the position of your grade within this grade band.

50-59% A submission in this mark band indicates work of a good standard. You will have met the requirements of the previous grade band and also implemented the recording of play and replay of earlier games. You will have considered the algorithms and data structures used in your solution and recorded this within your report(s). Your report(s) will be well written, include all sections, and will reference the material you have used.

60-69% To achieve a mark in this band means that you have been a little more ambitious and are achieving at a level that indicates very good work. You will have met the requirements of the previous grade band and also implemented the undo and redo features, underpinned by an appropriate choice of, and implementation of, data structures and algorithms. You will have considered how to evaluate your work and may have included some results. Your reports(s) will address all the necessary sections effectively, be very well written, clearly presented, and well referenced.

70-100% A submission in this mark band will consist of a game that offers an excellent level of functionality, both in terms of the number of features and their quality of implementation. You will have met the requirements of the previous grade band and also implemented all requirements to an excellent

standard. Your choices of data structures and algorithms will be both appropriate and justified in your reports(s), taking performance and complexity into account. Your game will be playable, robust, and well designed with appropriate, and justified selections of data structures and associated algorithms. Your report(s) will be comprehensive, include all mandated sections, be very well written and presented and will correctly reference all the material you have used. This is likely to include textbooks, online forums, and tutorials and some of the suggested reading for the module. Furthermore, your report(s) will provide an excellent justification for why you have implemented your solution in the manner that you have chosen. The quality of your implementation and associated report(s) will dictate the position of your grade within this grade band. To achieve a grade more than 80% you must go beyond the taught material formally covered in the module and incorporate your own self-directed reading and research. Some suggestions for direction of development at this level were made above.
